DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
3. Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lapid (US 2004/0087288).

Claim 1.

Lapid discloses a method of determining input power in a cable modem, comprising;
determining internal gain levels with a first cable modem across a plurality of frequencies and a plurality of transmission power levels, see paragraph [0061]. Though not described, thus determined internal gain level is stored for setting the cable modem. See claim

11. Lapid fails to teach determining internal gain levels with a second cable modem.

Art Unit: 2611

However, it would have been obvious to apply the same method of determining input power in a cable modem, as taught by Lapid, to another cable modem.

Claim 2.

See paragraph [0062] for the adjustment of internal power levels.

Claim 3.

Since the cable modem is a receiver receiving a signal from an external node, the power level is between the tuner, i.e., the cable modem, and an external node.

Claim 4.

See paragraph [0061] teaching RF AGC values, which is in combination with IF AGC, determines the total gain.

Claims 5, 6, 8.

See paragraph [0061] teaching measuring the gain levels across a plurality of frequencies.

Claim 7.

When the gain level is linear across frequencies, it would have been obvious to determine gain level on some of the frequencies by linear interpolation for the purpose of avoiding measuring gains on all the frequencies.

Claim 9.

Lapid fails to teach determining internal gain levels with a third cable modem. However, it would have been obvious to apply the same method of determining input power in a cable modem, as taught by Lapid, to as many cable modems as desired.

Allowable Subject Matter

4. Claims 12 - 37 are allowed.

Art Unit: 2611

5. Claims 10 and 11 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
